

Agent-based model using Agents.jl

Simon Frost (@sdwfrost), 2020-04-27

Introduction

The agent-based model approach, implemented using [Agents.jl](#) taken here is:

- Stochastic
- Discrete in time
- Discrete in state

Libraries

```
using Agents
using Random
using DataFrames
using Distributions
using DrWatson
using StatsPlots
using BenchmarkTools
```

Utility functions

```
function rate_to_proportion(r::Float64,t::Float64)
    1-exp(-r*t)
end;
```

Transitions

First, we have to define our agent, which has an `id`, and a `status` (:S,:I, or :R).

```
mutable struct Person <: AbstractAgent
    id::Int64
    status::Symbol
end
```

This utility function sets up the model, by setting parameter fields and adding agents to the model.

```
function init_model( $\beta$ ::Float64,c::Float64, $\gamma$ ::Float64,N::Int64,I0::Int64)
    properties = @dict( $\beta$ ,c, $\gamma$ )
    model = ABM(Person; properties=properties)
    for i in 1:N
        if i <= I0
            s = :I
        else
            s = :S
        end
    end
```

```

        p = Person(i,s)
        p = add_agent!(p,model)
    end
    return model
end;

```

The following function applies a series of functions to each agent.

```

function agent_step!(agent, model)
    transmit!(agent, model)
    recover!(agent, model)
end;

```

This is the transmission function; note that it operates on susceptibles making contact, rather than being focused on infected. This is an inefficient way of doing things, but shows the parallels between the different implementations.

```

function transmit!(agent, model)
    # If I'm not susceptible, I return
    agent.status != :S && return
    ncontacts = rand(Poisson(model.properties[:c]))
    for i in 1:ncontacts
        # Choose random individual
        alter = random_agent(model)
        if alter.status == :I && (rand() ≤ model.properties[:β])
            # An infection occurs
            agent.status = :I
            break
        end
    end
end;

```

This is the recovery function.

```

function recover!(agent, model)
    agent.status != :I && return
    if rand() ≤ model.properties[:γ]
        agent.status = :R
    end
end;

```

We need some reporting functions.

```

susceptible(x) = count(i == :S for i in x)
infected(x) = count(i == :I for i in x)
recovered(x) = count(i == :R for i in x);

```

Time domain

```

δt = 0.1
nsteps = 400
tf = nsteps*δt
t = 0:δt:tf;

```

Parameter values

```
 $\beta$  = 0.05  
c = 10.0* $\delta t$   
 $\gamma$  = rate_to_proportion(0.25, $\delta t$ );
```

Initial conditions

```
N = 1000  
I0 = 10;
```

Random number seed

```
Random.seed!(1234);
```

Running the model

```
abm_model = init_model( $\beta$ ,c, $\gamma$ ,N,I0)  
  
AgentBasedModel with 1000 agents of type Person  
no space  
scheduler: fastest  
properties: Dict(: $\gamma$  => 0.024690087971667385,:c => 1.0,: $\beta$  => 0.05)  
  
to_collect = [(:status, f) for f in (susceptible, infected, recovered)]  
abm_data, _ = run!(abm_model, agent_step!, nsteps; adata = to_collect);
```

Post-processing

```
abm_data[:,t] = t;
```

Plotting

```
plot(t,abm_data[:,2],label="S",xlab="Time",ylabel="Number")  
plot!(t,abm_data[:,3],label="I")  
plot!(t,abm_data[:,4],label="R")
```

Benchmarking

```
@benchmark begin
  abm_model = init_model( $\beta$ ,c, $\gamma$ ,N,I0)
  abm_data, _ = run!(abm_model, agent_step!, nsteps; adata = to_collect)
end
```

```
