

Stochastic differential equation model using StochasticDiffEq.jl

Simon Frost (@sdwfrost), 2020-04-27

Introduction

A stochastic differential equation version of the SIR model is:

- Stochastic
- Continuous in time
- Continuous in state

This implementation uses `StochasticDiffEq.jl`, which has a variety of SDE solvers.

Libraries

```
using DifferentialEquations
using StochasticDiffEq
using Random
using SparseArrays
using DataFrames
using StatsPlots
```

Transitions

We begin by specifying the ODE kernel.

```
function sir_ode!(du,u,p,t)
    (S,I,R) = u
    (β,c,γ) = p
    N = S+I+R
    @inbounds begin
        du[1] = -β*c*I/N*S
        du[2] = β*c*I/N*S - γ*I
        du[3] = γ*I
    end
    nothing
end;

# Define a sparse matrix by making a dense matrix and setting some values as not zero
A = zeros(3,2)
A[1,1] = 1
A[2,1] = 1
A[2,2] = 1
A[3,2] = 1
A = SparseArrays.sparse(A);
```

```

# Make `g` write the sparse matrix values
function sir_noise!(du,u,p,t)
    (S,I,R) = u
    ( $\beta$ ,c, $\gamma$ ) = p
    N = S+I+R
    ifrac =  $\beta$ *I/N*S
    rfrac =  $\gamma$ *I
    du[1,1] = -sqrt(ifrac)
    du[2,1] = sqrt(ifrac)
    du[2,2] = -sqrt(rfrac)
    du[3,2] = sqrt(rfrac)
end;

```

Time domain

Note that even though I'm using fixed time steps, `DifferentialEquations.jl` complains if I pass integer timespans, so I set the timespan to be `Float64`.

```

 $\delta t$  = 0.1
tmax = 40.0
tspan = (0.0,tmax)
t = 0.0: $\delta t$ :tmax;

```

Initial conditions

```

u0 = [990.0,10.0,0.0]; #  $S, I, R$ 

```

Parameter values

```

p = [0.05,10.0,0.25]; #  $\beta, c, \gamma$ 

```

Random number seed

```

Random.seed!(1234);

```

Running the model

```

prob_sde = SDEProblem(sir_ode!,sir_noise!,u0,tspan,p,noise_rate_prototype=A)

```

```

SDEProblem with uType Array{Float64,1} and tType Float64. In-place: true
timespan: (0.0, 40.0)
u0: [990.0, 10.0, 0.0]

```

```

sol_sde = solve(prob_sde,SRA1());

```

Post-processing

We can convert the output to a dataframe for convenience.

```
df_sde = DataFrame(sol_sde(t)')  
df_sde[!,:t] = t;
```

Plotting

We can now plot the results.

```
@df df_sde plot(:t,  
  [:x1 :x2 :x3],  
  label=["S" "I" "R"],  
  xlabel="Time",  
  ylabel="Number")
```

Appendix

Computer Information

```
Julia Version 1.4.0  
Commit b8e9a9ecc6 (2020-03-21 16:36 UTC)  
Platform Info:  
  OS: Windows (x86_64-w64-mingw32)  
  CPU: Intel(R) Core(TM) i7-8550U CPU @ 1.80GHz
