

Function map

Simon Frost (@sdwfrost)

2020-04-27

Introduction

The function map approach taken here is:

- Deterministic
- Discrete in time
- Continuous in state

Libraries

```
using DifferentialEquations
using SimpleDiffEq
using DataFrames
using StatsPlots
using BenchmarkTools
```

Utility functions

To assist in comparison with the continuous time models, we define a function that takes a constant rate, r , over a timespan, t , and converts it to a proportion.

```
@inline function rate_to_proportion(r::Float64,t::Float64)
    1-exp(-r*t)
end
```

rate_to_proportion (generic function with 1 method)

Transitions

We define a function that takes the 'old' state variables, u , and writes the 'new' state variables into du . Note that the timestep, δt , is passed as an explicit parameter.

```
function sir_map!(du,u,p,t)
    (S,I,R) = u
    ( $\beta$ ,c, $\gamma$ , $\delta t$ ) = p
    N = S+I+R
```

```

infection = rate_to_proportion( $\beta$ *c*I/N, $\delta t$ )*S
recovery = rate_to_proportion( $\gamma$ , $\delta t$ )*I
@inbounds begin
    du[1] = S-infection
    du[2] = I+infection-recovery
    du[3] = R+recovery
end
nothing
end

sir_map! (generic function with 1 method)

```

Time domain

Note that even though I'm using fixed time steps, `DifferentialEquations.jl` complains if I pass integer timespans, so I set the timespan to be `Float64`.

```

 $\delta t$  = 0.1
nsteps = 400
tmax = nsteps* $\delta t$ 
tspan = (0.0,nsteps)
t = 0.0: $\delta t$ :tmax;

```

Initial conditions

Note that we define the state variables as floating point.

```

u0 = [990.0,10.0,0.0]

3-element Array{Float64,1}:
 990.0
  10.0
   0.0

```

Parameter values

```

p = [0.05,10.0,0.25, $\delta t$ ] #  $\beta, c, \gamma, \delta t$ 

4-element Array{Float64,1}:
 0.05
 10.0
 0.25
 0.1

```

Running the model

```

prob_map = DiscreteProblem(sir_map!,u0,tspan,p)

DiscreteProblem with uType Array{Float64,1} and tType Float64. In-place: tr
ue
timespan: (0.0, 400.0)
u0: [990.0, 10.0, 0.0]

```

```

sol_map = solve(prob_map,solver=FunctionMap)

retcode: Success
Interpolation: left-endpoint piecewise constant
t: 401-element Array{Float64,1}:

```

Post-processing

We can convert the output to a dataframe for convenience.

```

df_map = DataFrame(sol_map')
df_map[:,t] = t;

```

Plotting

We can now plot the results.

```
@df df_map plot(:t,  
  [:x1 :x2 :x3],  
  label=["S" "I" "R"],  
  xlabel="Time",  
  ylabel="Number")
```

Benchmarking

```
@benchmark solve(prob_map,solver=FunctionMap)
```

BenchmarkTools.Trial:

memory estimate: 59.11 KiB

allocs estimate: 479

minimum time: 84.200 μ s (0.00% GC)

median time: 122.300 μ s (0.00% GC)

mean time: 162.954 μ s (4.00% GC)

maximum time: 14.338 ms (97.91% GC)

samples: 10000

evals/sample: 1
